# ERP Product Overview

An Integrated Digital Platform from Business Execution to Management Control

Unified business data · Integrated procurement, sales, inventory, manufacturing, and finance · Intelligent analytics and end-to-end auditability

**Integrated Operations**

Cross-department document and status linkage

**Manufacturing Core**

Planning, production orders, material issue/return, completion, and cost

**Governable and Auditable**

Permissions, licensing, operations, and master-data change trails

# 1. Product Positioning

Linova One ERP is designed for growing and mid-sized organizations seeking a unified business platform. A single system connects master data, procurement, sales, inventory, manufacturing, finance, and system governance. The product emphasizes closed-loop processes, consistent data, traceable execution, and analyzable outcomes, helping reduce information silos, duplicate entry, and cross-department reconciliation.

Unified access: centralized sign-in for multiple companies, languages, and users.

# 2. Core Product Value

| Item                     | Description                                                                                                                                                |
|--------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------|
| One Data Foundation      | Items, customers, suppliers, warehouses, and BOMs are maintained centrally and referenced directly by transactions, reducing duplicate master data.        |
| One Business Chain       | Procurement, inventory, sales, manufacturing, and finance connect naturally through document relationships, with business statuses advancing step by step. |
| One Management View      | Cockpits, inquiries, ledgers, and intelligent summaries help managers quickly understand operational and execution status.                                 |
| One Governance Framework | Users, roles, permissions, licensing, approvals, and audit form the foundation for security and internal control.                                          |

## 3. Eight Capability Areas

### Master Data Management

Establishes a unified enterprise data standard and provides the foundation for all transactions and planning calculations.

Representative capabilities: Item Master, Bill of Materials, Customer Master, Supplier Master, Warehouse Master, Master Data Change Audit.

### Procurement Management

Creates a closed loop from purchase demand through execution, receiving, invoice verification, and returns.

Representative capabilities: Purchase Requisition, Purchase Order, Purchase Order Inquiry, Goods Receipt, Goods Receipt Inquiry, Invoice Verification and more.

### Sales Management

Covers quotations, sales orders, shipments, billing, confirmations, returns, and export business.

Representative capabilities: Quotation Management, Sales Order, Order Inquiry, Shipment Management, Shipment Inquiry, Billing Management and more.

### Inventory Management

Supports supply chain and manufacturing execution with real-time inventory, movement records, lot tracking, and stock counts.

Representative capabilities: Inventory Overview, Inventory Transfer, Inventory Ledger, Lot Tracking, Stock Count Management.

### Manufacturing

Creates a manufacturing closed loop from demand planning through production orders, material issue/return, completion, and cost accumulation.

Representative capabilities: Material Requirements Planning, Production Order, Production Order Inquiry, Material Issue, Production Completion, Material Return and more.

### Financial Management

Connects business documents to accounts receivable, accounts payable, collections/payments, general ledger, and period closing in a closed loop.

Representative capabilities: Accounts Receivable, Collection Entry, Collection Inquiry, Accounts Payable, Payment Entry, Payment Inquiry and more.

### Intelligent Assistant

Improves the efficiency of querying, explanation, and summarization through natural language and business context.

Representative capabilities: Natural Language Query, Exception Explanation, Report Summary.

### System Administration

Builds enterprise-grade governance around users, roles, permissions, licensing, and audit.

Representative capabilities: User Management, Role Management, Permission Management, License Management, Operation Audit.

## 4. Typical Business Scenarios

### Order Fulfillment Collaboration

After a sales order is created, the warehouse ships against the order and inventory is updated automatically. Settlement flows to accounts receivable, and customer collection completes the cash cycle.

### Procurement and Replenishment Collaboration

Purchase demand is converted into a purchase order. Receipt increases inventory and provides the basis for subsequent invoicing and accounts payable, eliminating duplicate entry between procurement and finance.

### Planning and Manufacturing Collaboration

Requirements planning identifies material shortages. Production orders drive material issue and completion, while inventory and cost are recorded in sync and managers can monitor order progress.

### Lot and Inventory Traceability

Inventory ledgers and lot information track sources, movements, and destinations, supporting businesses with traceability requirements.

### Operational and Exception Analysis

Natural-language queries, exception explanations, and report summaries help users derive conclusions from business data faster.

## 5. Product Design Features

- Modular navigation: business domains are clearly separated, so users only enter the modules relevant to their roles.
- Consistent interaction: entry, inquiry, action controls, and business-context layouts follow a common pattern to reduce learning effort.
- Status-driven processing: documents use clear statuses from creation through execution to completion or closure, simplifying process control.
- Context assistance: the right-side business context area can present statistics, relationships, guidance, and document information.
- Traceability: inquiry screens, inventory ledgers, master-data audit, and operation audit work together to create an end-to-end traceability framework.
- Extensibility: standardized boundaries around core objects and business flows support future expansion of interfaces, approvals, reports, and industry-specific functions.

# 6. Intelligent Capabilities

The system includes an intelligent assistant that combines traditional report inquiry with natural-language interaction. Users can ask questions about business data, request explanations of exceptions, or generate report summaries, enabling non-technical users to obtain business insights quickly.

Intelligent Assistant: natural-language queries, exception explanations, and report summaries.

# 7. Security and Governance

- Access control based on users, roles, and permissions.
- System license management and sign-in authorization validation.
- Logs for critical operations and master-data changes.
- Approval review can be applied to critical sales transactions.
- Financial period closing protects the data boundary of closed periods.

## 8. Why It Fits Manufacturing and Trading Enterprises

For manufacturing and trading enterprises, the main challenge is usually not an individual function but whether procurement, inventory, sales, manufacturing, and finance can stay connected in real time. Linova One ERP centers on items and business documents, linking planning, physical movement, fulfillment, and financial outcomes so the organization can answer key questions in one system: What should be purchased? What should be produced? Where is the inventory? How far has an order progressed? Has money been collected or paid? Who changed the data?

## 9. Recommended Rollout Scope

| Item                | Description                                                                                                       |
|---------------------|-------------------------------------------------------------------------------------------------------------------|
| Foundation Phase    | Master data, user/role/permission management, procurement, sales, and inventory.                                  |
| Manufacturing Phase | BOM, requirements planning, production orders, material issue/return, completion, and costing.                    |
| Finance Phase       | Accounts receivable, accounts payable, collections/payments, general ledger, and period closing.                  |
| Optimization Phase  | Lot tracking, approval review, intelligent queries, exception explanations, report summaries, and audit analysis. |

## 10. Product Summary

Linova One ERP is designed not to simply accumulate features, but to use unified data, standardized processes, and consistent controls so daily transactions run smoothly, managers see the true operating status, and financial outcomes arise naturally from source business activities. With eight capability areas and end-to-end processes, the system can serve as a core platform for enterprise digital operations.
